1 Introduction

The Cariban language family is one of the largest of South America, with between 60'000 and 100'000 speakers unevenly distributed between 22 to 25 extant languages (Gildea 2012: 441). The family is concentrated in Venezuela, the Guianas and Northern Brazil, with two Western and four Southern outliers. Figure 1 shows the geographical distribution and genealogical affiliation of the extant Cariban languages. For linguistic overviews of and comparative work on the family, readers are referred to Gildea (1998), Derbyshire (1999), Meira (2002), Meira & Franchetto (2005), Meira (2006a), Gildea & D. Payne (2007), Meira et al. (2010), Gildea et al. (2010), Gildea (2012), Matter (2021a), and Gildea & Cáceres (in preparation).

[Figure 1 about here.]

[Table 1 about here.]

[Table 2 about here.]

In some Cariban languages, a small group of verbs show a divergent first person inflection pattern, a topic which has not received much attention in the literature. This is illustrated with person paradigms of four Hixkaryána verbs in Table 1,¹ all members of the S_A inflectional class. In this language, the verb ‘to be’ diverges from other S_A verbs like ‘to fall’ by having a first person marker *w-*, rather than *k-*. A similar pattern exists in Tiriyo, where the verb ‘to go’ has a first-person prefix *wi-* while other S_A verbs have a prefix with phonologically conditioned allomorphs *t-* / *_ə* and *s-* / *_e* (Table 2). In both languages, the first person prefix of the verbs on the left is representative for the vast majority of S_A verbs.

Such divergent verbs have been identified for Hixkaryána (Derbyshire 1985: 188), Waiwai (Gildea 1998: 90), the three Taranoan languages (Meira 1998: 112–115), Bakairi (Meira 2003a), and Arara (Alves 2017: 153), but have only been subject to comparative scrutiny in Meira’s (1998) reconstruction of Proto-Taranoan. In a synchronic analysis of a language, these verbs and their first person prefixes may be called IRREGULAR, contrasting with regular prefixes (like Hixkaryána *ki-* and Tiriyo *t-/s-*) on regular verbs. However, there is no widely accepted definition of irregularity (Stolz et al. 2012), and many stricter definitions (e.g., Haspelmath & Sims 2010) require the pattern to occur at a single place in the grammar. For such approaches, these verbs simply belong to a small inflectional (sub-)class, an analysis applied to the Pekodian languages Bakairi and Arara (Meira 2003a: 4; Alves 2017: 149).

Ignoring the specifics of synchronic analysis, the cause for the divergent inflectional patterns lies in the diachrony of the languages in question. The goal of this study is to approach the patterns from

¹The presence of a 1+2 person value implies that of a 1+3 value. This is usually expressed with a free pronoun combined with third person morphology in Cariban languages, so it is not represented as a distinct value in the paradigms shown here. In Table 1 and other paradigm tables, any TAM suffixes found in the original forms found in the literature are omitted, since a) the focus lies on the prefixes and stems, and b) full paradigms containing the same TAM suffix are rarely found. Further, standard IPA symbols are used in the transcription of Cariban languages, with the exception of coronal rhotics, which are simply represented with ⟨r⟩, rather than ⟨ɽ⟩ for Wayana or ⟨ɽ⟩ for Ye'kwana etc. In languages with strong morphophonological processes and/or subphonemic orthography the original transcription is shown in an additional surface line when presented in interlinearized examples. Gildea (2018) is followed in using ⟨ə⟩ for the proto-vowel reconstructed by Meira & Franchetto (2005), although it was likely more back (Gildea et al. 2010). Glossing abbreviations:

a comparative perspective and to provide a diachronic and functional account, proceeding as follows: In Section 2, relevant aspects of the Proto-Cariban verbal system are introduced, and it is shown that the mechanism of person marker extensions is responsible for patterns like the Hixkaryána and Tiriyo ones. In Section 3, six incomplete person marker extensions and the verbs unaffected by them are described. Since conservative verbs show a considerable etymological overlap between languages, they are further discussed and reconstructed. Section 4 uses Bybee's (1985) network model of morphology to search explanations for the verbs (un-)affected by each extension. Section 5 summarizes and discusses the results of the study.

2 The origins of conservative first person inflections

The irregular first person prefixes from Section 1 are relics, inherited from the ancestral Proto-Cariban system (Section 2.1). That system underwent much innovation; the mechanism responsible for the irregular forms are person marker extensions not spreading through the entire S_A lexicon (Section 2.2). A specific aspect of the system, the S_A vs S_P distinction, plays a role in incomplete extensions and is discussed in Section 2.3.

2.1 Proto-Cariban person marking and inflectional relics

Proto-Cariban is reconstructed by Gildea (1998) as using a person paradigm called Set I in its independent verb forms, shown in Table 3. Person indexation in transitive verbs was conditioned by a basic hierarchy $1/2 > 3$. The locuphoric markers had two forms, an A-oriented one for direct ($SAP > 3$) scenarios and a P-oriented one for inverse ($3 > SAP$) scenarios. There was a single aliophoric marker $*n(i)$ -, which only surfaced in nonlocal ($3 > 3$) scenarios, without morphologically expressed distinctions between different third person referents. Local scenarios were expressed in a non-transparent manner, both using the $1+2$ prefix $*k$ -.

[Table 3 about here.]

Formally identical or etymologically related markers occurred in intransitive verbs, which showed a split-S system (Table 3b). That is, S_A verbs took similar markers as the A-oriented ones in transitive verbs, with the exception of first person ($1S_A$ $*w$ - vs $1 > 3$ $*t(i)$ -) and the absence of $*i$ after all S_A prefixes. On the other hand, S_P verbs took markers fully identical to the P-oriented ones, and $3S_P$ $*n(i)$ - aligning with $3 > 3$ scenarios.

Knowledge about the ancestral system makes clear that the divergent Hixkaryána and Tiriyo forms in Tables 1 and 2 behave irregularly because they preserve the original Proto-Cariban $1S_A$ prefix $*w$ -; they are therefore CONSERVATIVE. They contrast with regular S_A verbs, which are innovative in both languages. The reflexes of $*w$ - are RELICS, old and restricted to a few lexemes, contrasting with the innovative prefixes found elsewhere. These verbs and their prefixes are comparable with the few English nouns like *oks*, which preserve the old plural suffix *-ən*. It was once more widespread as the normal plural suffix of the weak inflection, compare German *oks-ən* 'ox-en', *namə-n* 'name-s', *hazə-n* 'hare-s', *be:ɪ-ən* 'bear-s'.

Since the regular Hixkaryána and Tiriyo prefixes are innovative, one may ask where they came from.

2.2 Person marker extensions and lexical diffusion

In his discussion of the Proto-Cariban split-S system (Section 2.3) and reconstruction of the intransitive person prefixes, Gildea (1998: 88–96) shows that the system has undergone many different changes in daughter languages. The main mechanism of these changes are PERSON MARKER EXTENSIONS, i.e. person prefixes being extended to verbal paradigm cells previously occupied by other prefixes. There have been quite a few person marker extensions in Caribbean languages, some still ongoing. Gildea (1998) illustrates this with the three Parukotoan languages Werikyana, Hixkaryána, and Waiwai. Apart from segmental changes to individual morphemes, the following innovations happened in the Set I paradigm in Parukotoan:

- | | | |
|-----|------------------|---|
| (1) | Proto-Parukotoan | 1S _A * <i>w</i> - to 1>3 |
| | | 1+2 * <i>k</i> - to 1S _P (completed in Proto-Waiwaian, ongoing in Werikyana) |
| | | 1+2 * <i>kit</i> - to 1+2S _P (completed in Proto-Waiwaian, ongoing in Werikyana) |
| | Proto-Waiwaian | 1S _P * <i>k</i> - to 1S _A |
| | | * <i>owi(ro)</i> <i>j</i> - ‘1PRO LK’ for 1P |
| | Waiwai | 2S _A <i>m</i> - to 2S _P |

All innovations are person marker extensions except 2b, which combined a pronoun with the linker **j*-. Figure 2 shows them in bold and reproduces Gildea’s (1998) tables as a tree diagram, with adapted transcription and an additional Werikyana 1S_P marker Ø/*j*- (Spike Gildea, p.c.).

[Figure 2 about here.]

Hixkaryána has preserved split-S only in the second person prefixes, while Werikyana still shows the variation reconstructible to Proto-Parukotoan in its first person and 1+2 prefixes. Waiwai has lost the system entirely, which notably happened via three diachronically distinct innovations.

For Gildea (1998), person marker extensions are relevant for loss of split-S and the accompanying changes to indexing alignment, whereas this study focuses on a different aspect of these extensions. Namely, they most likely took place via lexical diffusion, characterized as a type of extension by Harris & Campbell (1995: 106–115), a hypothesis supported by three facts. First, the variation in first person and 1+2 prefixes described above for Werikyana is not completely free. Some verbs only allow e.g. first person *k*-, but not *j*-, while others can occur with both, a pattern expected in a lexical diffusion scenario. In addition, this is speaker-dependent (Spike Gildea, p.c.), which points to an ongoing change. Second, while there is no detailed diachronic account of the switch of 1>3 **t*- and 1S_A **w*- in the Tiriyoan languages (Section 3.1.3), Meira (1998: 111–112) argues that it must have happened gradually rather than instantaneously, and entailed both markers spreading simultaneously. Whether or not this gradual switch followed ordered lines, lexical diffusion must have played a role.

The third argument in favor of the lexical diffusion scenario goes back to the conservative Hixkaryána and Tiriyo forms in Tables 1 and 2. Both innovative 1S_A prefixes were introduced by a person marker extension spreading via lexical diffusion. The continued presence of the old 1S_A prefix in a few verbs is the result of the extension stopping short of these verbs, rather than spreading through the entire S_A lexicon. In a family-wide search, 18 distinct extensions affecting intransitive verbs were identified, 6 of them incomplete. The latter have left between 1 and 7 conservatively inflected verbs in 9 Caribbean languages (Section 3).

Interestingly, all six featured innovative first person markers on S_A verbs. All other (complete) extensions² either occurred with other person values and/or targeted S_P verbs. Illustrative examples for complete extensions are shown in Table 4: the extension of $1+2S_A s(i)-$ ($< *kit-$) to S_P verbs in Apalaí (Table 4a), of $2S_A m(i)-$ in to S_P verbs in Panare (Table 4b), and the extension of the entire S_A set to S_P verbs in Waimiri-Atroari (Table 4c). The starkly different behavior of S_A and S_P verbs regarding extensions points to the split-S system playing a role, so its main properties will be discussed in Section 2.3. It will also be made clear how the S_A/S_P distinction can be lost for a single person, or how S_P verbs can take on S_A markers with apparent semantic impunity.

[Table 4 about here.]

2.3 The Cariban split-S system

As seen in Section 2.1, the split between S_A and S_P verbs was instantiated by inflection classes within the Proto-Cariban Set I person paradigm, but this was not the only inflectional criterion: In deverbalized forms, S_A verbs took a class marker $*w-$, while S_P verbs lacked that prefix (Gildea 1998: 89, 141–142; Meira 2000: 208). The distinction between S_A and S_P was also reflected in imperatives, where the latter took the $2S_P$ prefix $*\partial(j)-$ while the former were unprefixes (Gildea 1998: 89; Meira 2000: 208).

In modern instantiations of Cariban split-S, mismatches between the semantics of verbs and their S_A or S_P status are common, exemplified with Kari’ña data in (2).

(2) Kari’ña

- a. *sipi tink-a-ri m-ekema-non hen*
net pull-NMLZ $2S_A$ -be.afraid-PRS.UNCERT eh?
‘You’re afraid to pull up the net, aren’t you?’ (Courtz 2008: 253)
- b. *aya:woiya*
aj-awomi-ja
 $2S_P$ -get.up-PRS
‘You are getting up.’ (Hoff 1968: 167)

The S_A verb *ekema* ‘to be afraid’ takes an A-oriented marker (2a), while the S_P verb *awomi* ‘to get up’ takes a P-oriented marker (2b). In both cases, the prefix does not appear to contribute to the semantics of the predicate, since there are clear mismatches: ‘to be afraid’ with an “agentive” marker can hardly be considered a volitional act, while ‘to get up’ with a “patientive” marker is clearly volitional. Meira (2000) investigates a corpus of intransitive verbs from Tiriyo, Kari’ña, Apalaí, and Wayana, and categorizes them by applying different criteria commonly encountered in split-S systems. He shows that neither (non)activities, (non-)agency, (in-)animacy, nor Aktionsart satisfactorily predict the class membership of intransitive verbs in any of the languages.

Rather, the reason for a verb to take A- or P-oriented prefixes is (at least diachronically) a morphological one. Meira (2000: 217–221) demonstrates that those intransitive verbs which (etymologically)

²As an honorable mention, when Ikpeng replaced third person Set I with Set II prefixes, *a* ‘to be’ and *ke* ‘to say’ retained *n-* (Matter 2021b: 12). However, the spread of the innovative markers had an entirely different dynamic, spreading from subordinate to main clauses.

have a derivational detransitivizing prefix are treated as S_A verbs, while essentially all others are S_P verbs:

Almost all verbs in the S_A class are detransitized forms of transitive verbs, either synchronically (with still existing transitive sources) or diachronically (with reconstructible but no longer existing transitive sources) (Meira 2000: 201)

He notes that this leads to an inflectional split not based in meaning, but rather morphology:

Apparently, the morphological behavior of the S_A verb class is an accidental consequence of the fact that detransitivization, as far back as we can reconstruct, entails all the morphology described [...] as typical of S_A verbs. The alignment of person-marking prefixes appears not to be driven by any semantic forces in the language; it is as though they were being dragged by the evolution of the reflexive marker. (Meira 2000: 226)

Regarding the form of this marker, Meira et al. (2010: 505–512) reconstruct two distinct prefixes for Proto-Cariban: reciprocal $*\text{ate-}$ and reflexive $*e-$, although their reflexes on verbs have been merged into a single morpheme in modern languages. Reflexes of $*\text{ate}/e-$ show a range of meanings summarizable as “detransitive”, illustrated with Tiriyo S_A verbs in (3).

(3) Tiriyo (Meira 2000: 218–219, 1999: 128, 256)

<i>nonta</i> 'abandon'	→	<i>e-nonta,</i> <i>ai-nonta</i>	'abandon each other' (reciprocal)
<i>suka</i> 'wash'	→	<i>e-suka,</i> <i>ai-suka</i>	'wash self' (reflexive)
<i>pahka</i> 'break (TR)'	→	<i>e-pahka</i>	'break (INTR)' (anticausative)
<i>puunapi</i> 'think about'	→	<i>ah-puunapi,</i> <i>ai-puunapi</i>	'think, meditate' (antipassive)

The morphological variation in ‘to abandon each other’ and ‘to wash self’ is due to the collapse of the two Proto-Cariban prefixes: $e-$ comes from the reflexive prefix $*e-$, while the form $ai-$ originates in reciprocal $*\text{ate-}$. However, both can occur with either meaning – at least for these two verbs. In the next section, it will become apparent that many of the verbs not affected by person marker extensions belong to the small group of S_A verbs without a reflex of $*\text{ate}/e-$.

3 Inflections and verbs: innovation and resistance

As shown in Section 2.2, irregularly inflected first person forms are leftovers from incomplete person marker extensions. Section 3.1 presents the six identified incomplete extensions, the prefixes they introduced and the verbs they spared. Since the latter show considerable etymological overlap across

languages, these resistant verbs are compared and reconstructed in Section 3.2. Where existent, their reflexes which did get affected by one of the extensions are identified.

3.1 Incomplete extensions: the innovative $1S_A$ markers

As stated in Section 2.2, the six person marker extensions which did not affect all potential targets have in common that they introduced innovative first person markers on S_A verbs. Of these extensions, half can be reconstructed to intermediate proto-languages, and half happened in pre-modern stages of single languages. The sources of innovative markers vary, but not much: the innovative $1S_A$ prefix is formally identical to the $1+2P/S_P$ marker (Proto-Cariban $*k-$) in three cases, to the $1P/S_P$ marker (Proto-Cariban $*u(j)-$) in two cases, and to the $1>3$ marker (Proto-Cariban $*t-$) in one case. For each extension, regular (innovative) verbs are contrasted with irregular (conservative) ones, and verb forms are reconstructed where necessary. Section 3.1.1 details the extension of $*k-$ in Proto-Pekodian, reflected in the three daughter languages Arara, Ikpeng, and Bakairi. Section 3.1.2 treats the extension of $*k-$ in Proto-Waiwaian, which was briefly shown in Section 2.2. Section 3.1.3 focuses on innovative $*t-$ in Proto-Tiriyóan, reflected in modern Tiriyó and Akuriyó. The topic of Sections 3.1.4 to 3.1.6 are innovative $1S_A$ markers only found in single languages: $k-$ in Akuriyó, and $j-$ in Carijona and Yukpa.

3.1.1 Proto-Pekodian $*k-$

The Pekodian branch consists of closely related Arara and Ikpeng, with Bakairi as a more distant member. The contribution establishing the branch (Meira & Franchetto 2005) focused on phonology and lexicon, so no reconstructions of Proto-Pekodian morphosyntax are found in the literature. However, all three Pekodian languages have a regular $1S_A$ marker $k-$ (Table 5), allowing the reconstruction of a Proto-Pekodian $1S_A$ marker $*k-$.

[Table 5 about here.]

The most detailed description of a Pekodian language (Alves 2017) names six³ Arara S_A verbs forming a subclass defined by a first person marker $w(i)-$ rather than $k-$, shown in (4). There is also a reflex of the copula $*a[p]$, serving syntactically as a postposition introducing adverbial clauses meaning ‘if’ or ‘when’ (Alves 2017: 199–201). However, its inflectional morphology features verbal Set I prefixes, including first person $w-$ (5).

(4) Arara (Alves 2017: 153)

<i>wi-geni</i>	‘I said’
<i>w-iffini</i>	‘I was, lied down’
<i>w-ebini</i>	‘I came’
<i>w-ibini</i>	‘I bathed’
<i>w-iptoyri</i>	‘I went down’
<i>w-idoli</i>	‘I went’

(5) Arara (Alves 2017: 200)

1	<i>w-aptam</i> ‘when/if I was’
2	<i>m-od-aptam</i>
1+2	<i>kud-aptam</i>
3	<i>Ø-aptam</i>

³Seven under her analysis, which sees the two meanings of *iffi* ‘to be, to lie down’ as different verbs.

In his brief but precise discussion of Bakairi verbal person marking, Meira (2003a) reports the existence of two subclasses of S_A verbs, one taking first person *w-*, and one *k-*.⁴ The first group is illustrated with *i* ‘to bathe’ (6).

- (6) Bakairi (Meira 2003a: 4)
w-i-də
 1S_A-bathe-IMM
 ‘I bathed’

While Meira (2003a: 4) lists some Bakairi cognates of the Arara verbs in (4) as S_A verbs, he does not indicate whether they belong to the S_A-1 class with *k-*, or the S_A-2 class with *w-*. However, inflected forms can be found in von den Steinen (1892), presented in (7) according to the analyses of Bakairi phonology and verbal morphology by Wheatley (1969), Meira (2003a, 2005), and Franchetto & Meira (2016).

- (7) Bakairi (von den Steinen 1892: 131, 397, 76, 137, 374, 130)
- | | |
|---|--|
| <p>a. ⟨u-yépa⟩
 <i>u-ge-pa</i>
 1S_A-say-NEG
 ‘I don’t say.’</p> | <p>d. ⟨kχ-itaké-he⟩
 <i>k-itəgi-se</i>
 1S_A-go.down-NPST?
 ‘I go down.’</p> |
| <p>b. ⟨wi-táki⟩ / ⟨wi-tági⟩
 <i>w-i-taki</i>
 1S_A-be-INT
 ‘I was.’</p> | <p>e. ⟨úta⟩ / ⟨uúta⟩
 <i>u-tə</i>
 1S_A-go
 ‘I go.’</p> |
| <p>c. ⟨kχaewí-le⟩
 <i>k-æwi-lí</i>
 1S_A-come-IMM
 ‘I came.’</p> | <p>f. ⟨töre-w-akine⟩
 <i>təɾə w-a-kine</i>
 there 1S_A-be-PST.CONT
 ‘I was there.’</p> |

All descriptions of Ikpeng list *k-* as the only 1S_A marker (Pachêco 1997: 55; Campetela 1997: 105; Pachêco 2001: 64; Alves Chagas 2013: 205). However, most Ikpeng cognates of the verbs in question do not take *k-*, but rather *i-* or Ø (8), with the exception of *k-*-prefixed ‘to go’ (9). There is a formally identical Ikpeng cognate of Arara *iptonj* ‘to go down’, but no first person forms are attested (Angela Chagas, p.c.). While reflexes of **a[p]* ‘to be’ do exist in Ikpeng, apparently only reflexes of **eti* ‘to be’ occur with first person inflectional prefixes (Gildea 2018: 401).

⁴Meira (2003a) indicates that the same verbs which take first person *w-* in Bakairi also take a 1+2 marker *k-*. However, this marker is only illustrated for ‘to bathe’, both by Meira (2003a) and von den Steinen (1892). Given the lack of data for other verbs, this potential additional pattern will not be further discussed. If the characterization by Meira is accurate, then verbs with innovative first person prefixes have conservative 1+2 prefixes, and vice versa.

(8) Ikpeng

- a. *i-ge-li*
1-say-REC
'I said.' (Pachêco 2001: 209)
- b. *Ø-effi-li*
1-be-REC
'I was.' (Pachêco 2001: 139)
- c. *aŋagotpop Ø-ip-ŋi ik-gwa-kŋi*
always 1-bathe-NPST river-LOC.aquatic-ALL
'I always bathe in this river.' (Pachêco 1997: 68)

(9) Ikpeng (Pachêco 2001: 80)

- k-aran-ŋi*
1-go-NPST
'I'm going.'

[Table 6 about here.]

Reconstructed Proto-Pekodian forms of conservatively inflected verbs are given in Table 6. Newly identified Ikpeng *i-/Ø* is demonstrably a reflex of Proto-Xinguan **w(i)-*, based on other (albeit irregular) cases of loss of **w* (Table 7). Similarly, the change of **wi* to Bakairi *u* is found in correspondences like *udo* (Meira & Franchetto 2005) from Proto-Cariban **witoto* 'person' (Gildea & D. Payne 2007: 4). Thus, a 1_{SA} prefix **w(i)-* can securely be reconstructed to Proto-Pekodian, identical to its Arara reflex in form and distribution. In later, individual developments, Bakairi extended *k-* to 'to go down', and Ikpeng to 'to go'.

[Table 7 about here.]

Reconstructions of verb stems are deferred to Section 3.2, but a brief comment on 'to come' is in order: The stems are not fully cognate, as Ikpeng and Bakairi both show a reflex of the Proto-Pekodian detransitivizer **ad-* in combination with a root reconstructible as **epi*. In contrast, the Arara first person form is directly based on this root **epi*. However, reflexes of **ad-epi* can be found elsewhere in the Arara paradigm (10).

(10) Arara (Alves 2017: 150)

- m-odebi-ni*
2_{SA}-come-REC
'You came.'

In contrast, Ikpeng and Bakairi show reflexes of **ad-ebi* throughout the whole paradigm. Following Meira's (1998: 114) line of reasoning for a similar pattern in Taranoan (see also Section 3.1.3), the idiosyncratic pattern in Arara can be reconstructed to Proto-Pekodian, meaning that Bakairi and Ikpeng independently levelled the paradigm in favor of **ad-epi*.

3.1.2 Proto-Waiwaian *k-

This extension, one of the Parukotoan innovations shown in Section 2.2, resulted in the Hixkaryána patterns from Section 1. Proto-Waiwaian further extended the 1S_P prefix *k- innovated in Proto-Parukotoan to 1S_A. For regularly inflected verbs, this created a unified 1S category (Table 8).

[Table 8 about here.]

Not all S_A verbs were affected: Waiwai *ka* ‘to say’ does not take *ki-*, but rather conservative *wi-* (11a). Its Hixkaryána counterpart has a prefix *i-* (11b), which also occurs in 1>3 scenarios in Hixkaryána (11c), corresponding to Waiwai *w(i)-* (11d).

- (11) a. Waiwai (R. E. Hawkins 1998: 71)
wiikekne
wi-ka-jakne
 1-say-PST
 ‘I said.’
- b. Hixkaryána (Derbyshire 1985: 124)
roxehra nay hami Kaywerye ikekoni
ro-fe-hira n-a-je hami kajwer'e i-ka-jakoni
 1-DES-NEG 3-be-NPST.UNCERT EVID K. 1S_A-say-REM.CONT
 ‘I said (to myself), “Kaywerye evidently doesn’t like me”’
- c. Hixkaryána (Derbyshire 1985: 191)
i-koroka-no
 1>3-wash-IMM
 ‘I washed him.’
- d. Waiwai (R. E. Hawkins 1998: 192)
wŷyesŷ
wi-jo-jasi
 1>3-boil-NPST
 ‘I will boil it.’

The regular correspondence in transitive verbs points to Hixkaryána *i-* on intransitive verbs as another reflex of **wi-*, with a similar phonological reduction as in Ikpeng (Section 3.1.1). Notably, Derbyshire (1985) analyzes this *i-* as the regular 1>3 prefix, because he considers Hixkaryána *ka* ‘to say’ to be transitive (Section 3.2.1).

There are three more verbs which did not take innovative **k-* in Proto-Waiwaian (Table 9). The two forms for ‘to be’ are unproblematic, whereas ‘to go’ is a special case. While Hixkaryána has the expected *i-*, Waiwai seems to have combined innovative *k-* with the old **w-*, an etymological analysis also considered by Gildea (1998: 90). Alternatively, this form may have been influenced by deverbalized forms of ‘to go’, where a reflex of the S_A class marker **w-* has become fossilized (e.g., *o-wto-topo-nho* ‘my trip’ [R. E. Hawkins 1998: 92]) In any case, the first person form Hixkaryána ‘to go’ clearly points to Proto-Waiwaian **wi-tom-*.

[Table 9 about here.]

3.1.3 Proto-Tiriyoan **t-*

The moniker Tiriyoan (Hammarström et al. 2020) subsumes Tiriyo and Akuriyo, the more closely related of the three Taranoan languages identified by Girard (1971), with Carijona as a more distant member. Meira (1998) contributes an extensive phonological, morphological, and lexical reconstruction of Proto-Taranoan, facing an interesting puzzle in the Set I paradigms of Tiriyo and Akuriyo: Proto-Cariban 1>3 **t-* and 1S_A **w-* seem to have switched places. This resulted in a regular 1S_A marker of the form **ff-* / *_e*, **t-* / *_ə* (Table 10).⁵

[Table 10 about here.]

The question of how this switch happened in detail (Meira 1998: 107–112) still has no answer, although it seems necessary to assume a scenario in which both **t-* and **w-* for a time occurred on both transitive and intransitive verbs (Meira 1998: 112).⁶

[Table 11 about here.]

Turning to verbs not affected by the spread of **t-*, Meira (1998) reconstructs four of the items in Table 11 as taking **w-* in Proto-Taranoan, for which reconstructed Proto-Tiriyoan forms are substituted here. The other copular root **eʔi* can be added as a fifth verb, whose Tiriyo reflex retains first person *w-*. The idiosyncratic Akuriyo first person prefix *ə-* on ‘to go’ is identified as a reflex of **wi-* by Meira (1998: 113), which is supported the fact that both components of the irregular change **wi-* > *ə-* (loss of **w* and lowering of **i* to *ə*) are found in other person prefixes (12a–b).

(12) Akuriyo

- | | |
|--|--|
| <p>a. <i>wi-toka</i>
1>3-hit
‘I hit him/her.’ (Gildea 1994: 86)</p> | <p>b. <i>kəʔ-eepti</i>
1+2-come
‘We came.’ (Meira 1998: 114)</p> |
|--|--|

For ‘to come’, Meira (1998: 114–115) reconstructs Proto-Taranoan **əepti* for first person, and **eepti* for other persons, based on such a paradigmatic pattern in Tiriyo and the vowel length in Akuriyo. Both Akuriyo and Carijona then levelled this original distribution, similar to what was suggested for the Pekodian languages (Section 3.1.1). This scenario is plausible, with the exception that Tiriyo *əepti* is a reflex of **ət-jəpti* (Section 3.2.4), meaning that the Proto-Tiriyoan form would have been **əʔepti* (Proto-Taranoan **əffəpti*).

⁵The latter allomorph was subsequently replaced by *k-* in Akuriyo (Section 3.1.4).

⁶In fact, even the issue of *when* this happened is open. It could have happened at the Proto-Taranoan stage, but the subsequent introduction of *j-* in Carijona (Section 3.1.5) would have erased any traces of such an innovation. Accordingly, Meira (1998) hesitates to assign this extension to a specific proto-language. Here, a conservative stance is taken and the innovation is arbitrarily assumed to be Proto-Tiriyoan. This decision does not affect the results of this study.

3.1.4 Akuriyó *k-*

After the split of Proto-Tiriyoan, when **t-* and **tʃ-* had largely replaced **w-*, Akuriyó innovated a third 1S_A marker *k-*. It seems to have replaced **t-* only in specific environments, with the two markers showing a clear phonologically conditioned distribution in Gildea's (1994) Akuriyó data (Table 12). Meira (1998: 107) largely confirms that distribution, but mentions "several cases of first person *t-* in Akuriyó" (on *a*-initial verbs), albeit without any examples. He also suggests that *k-* might be more recent, which is plausible: since the distribution **t-* / *__a* / **tʃ-* / *__e* is reconstructible to Proto-Tiriyoan, the most straightforward scenario is *k-* replacing **t-* but not **tʃ-* in Akuriyó. The few *t-* mentioned by Meira (1998) were then perhaps reintroduced under Tiriyo influence. However, since there are no examples of, or more information about, *a*-initial verbs with *t-*, these cases cannot be discussed further.

[Table 12 about here.]

The verbs listed for Proto-Tiriyoan in Table 11 in Section 3.1.3 of course also resisted the extension of *k-* in Akuriyó, although the first-person form of the copular verb *eʔi* is unknown. In addition, there is an S_A verb *i(h)tə* 'to go down', which has an irregular first person marker *p-*, apparently reconstructible to Proto-Tiriyoan (13). It was not affected by the extension of Akuriyó *k-*, but whether it was an S_A verb when Proto-Tiriyoan **t-* was introduced is unclear (see Section 3.2.5).

- (13) First person forms of 'to go down'
 Tiriyo *p-ihət-* (Meira 1999: 294)
 Akuriyó *p-itə-* (Gildea 1994: 84)

3.1.5 Carijona *j-*

Carijona, the cousin of the Tiriyoan languages, has extended the 1S_P marker *j(i)*⁻⁷ to S_A verbs (Meira 1998: 105–107). Combined with the extension of 2S_A *m-* and 1+2S_A *kit-/kis-* to S_P verbs, this created a single unified S category for regular verbs (Table 13).

[Table 13 about here.]

Although the split-S system has been lost entirely, former S_A verbs can be identified by the presence of a detransitivizer, like *ehinəhi* 'to fight' (14), derived from *hinəhi* 'to kill' (Robayo Moreno 2000: 179).

- (14) Carijona (Koch-Grünberg 1908: 79)
heŋe(x)tónoko-máŋe y-e-heŋé(x)yaɪ
hinəhtono-ko=marə j-e-hinəhi-jai
 enemy-PL=with 1-DETRZ-kill-NPST.CERT
 'I fight with the enemies.'

As noted in Section 3.1.3, this extension also erased any traces of a putative Proto-Taranoan 1S_A marker **t-*. However, it did not fully eclipse the old 1S_A marker **w-*, which is attested as being preserved in the verbs *tə* 'to go' (15a) and *a* 'to be' (15b). In addition, the verb *ka* 'to say' has a zero-marked first-person form (15c).

⁷Since all affected S_A verbs are V-initial, only the / *__V* allomorph *j-* occurs in that context.

(15) Carijona (Guerrero-Beltrán 2016: 5, 42, personal communication)

- a. *wi-tə-e=rehe*
1-go-NPST=FRUST
'I almost go (but I am not going to go).'
- b. *aji-marə-ne w-a-e*
2-with-PL 1-be-NPST
'I am with you all.'
- c. *dēmēmara kae ewi tya*
n-tə-mə=mara Ø-ka-e əwi i-ja
3-go-PST=DUB 1-say-NPST.CERT 1PRO 3-OBL
'"Did s/he leave?", I say to him.'

Based on other C-initial verbs like *tə* 'to go' or *tuda* 'to arrive', one would expect *ka* 'to say' to either have conservative *wi-* or innovative *ji-*, so the zero needs explanation. It is analysed here as a reflex of **wi-*, primarily due to the loss of **w* in Ikpeng and Hixkaryána. While those developments were more regular, an already irregular marker undergoing idiosyncratic phonological erosion is not that surprising, see Akuriyó **wi-* > *ə-* in the preceding section. Alternatively, the divergent development of **w-* on *ka* 'to say' and *tə* 'to go' may be due to the latter's originally V-initial nature (Section 3.2.2).

3.1.6 Yukpa*j-*

The divergent nature of the family-internal isolate Yukpa is *inter alia* visible in the loss of many Set I forms and the formation of non-cognate innovative constructions (Meira 2006b). However, it does preserve the Set I prefixes in the immediate past, which shows a unified intransitive paradigm (Table 14). The wholesale loss of 1+2 as an inflectional value was combined with the extension of 2S_A *m(i)-* to (now former) S_P verbs like *nɪ* 'to sleep'.

[Table 14 about here.]

These verbs share their first person marker *j(i)-* with former S_A verbs like *otum* 'to wash self', identifiable by their semantics and the reflex of **əte/e-*. Since *j(i)-* is the reflex of the Proto-Cariban 1S_(P) marker **u(j)-* (Gildea 1998: 92), it also occurs on transitive verbs in 3>1 scenarios (16a). In contrast, 1>3 scenarios are zero-marked (16b).

(16) Yukpa (Meira 2006b: 139)

- a. *aw j-esare*
1PRO 3>1-see
'S/he saw me.'
- b. *aw Ø-esare*
1PRO 1>3-see
'I saw it.'

Since Proto-Cariban 1S_A *w(*t*)- was extended to 1>3 scenarios in most languages (Gildea 1998: 81–82), and given its inclination for phonological erosion (Sections 3.1.1 and 3.1.2), the zero marking in 1>3 scenarios can be identified as the Yukpa reflex of 1S_A *w-.

In intransitive verbs, this first-person zero marking is attested in a single verb, *to* ‘to go’ (17). It diverges from regular C-initial verbs with *ji*-, like ‘to sleep’ (Table 14). It can thus be identified as having resisted the extension of *j*- in Yukpa.

- (17) Yukpa (Meira 2006b: 139)
aw Ø-*to*
 1PRO 1S_A-go
 ‘I went.’

3.2 Conservative verbs in comparison

In Section 3.1, six incomplete extensions of personal prefixes into 1S_A territory were presented, and the verbs resistant to these innovations were identified. The set of unaffected verbs is rather small in most cases, and (proto-)languages show a considerable degree of overlap in what verbs are unaffected. Here, resistant verbs are investigated from a comparative perspective: **ka*[*ti*] ‘to say’ (Section 3.2.1), **ita*[*mə*] ‘to go’ (Section 3.2.2), both roots of the copula **eti/a*[*p*] (Section 3.2.3), *(*ət*)*jəpi* ‘to come’ (Section 3.2.4), **ipitə* ‘to go down’ (Section 3.2.5), and Section 3.2.6 investigates **e-pi* ‘to bathe’, of which the Proto-Pekodian reflex **ipi* resisted the extension of **k*-. The *e*-initial verbs not affected by the extension of *k*- in Akuriyó (Section 3.1.4) will not be discussed here, as they are a large and phonologically coherent group.

3.2.1 **ka*[*ti*] ‘to say’

Most reflexes of this verb are simply *ka*, but a fleeting syllable **ti* is reconstructed by Gildea & D. Payne (2007), best visible in the imperative forms of some languages. Table 15 shows a comparison of the longest attested forms for each language.⁸

[Table 15 about here.]

This verb was not affected by any of the extensions found in Proto-Pekodian, Proto-Waiwaian, Proto-Tiriyoan, Akuriyó, or Carijona (Sections 3.1.1 to 3.1.5). The first person form of its Yukpa reflex *ka* is unattested.

As mentioned in Section 3.1.2, Derbyshire (1985) analyzes this verb as transitive in Hixkaryána. This analytical choice is not only motivated by a desire to avoid an idiosyncratic intransitive first person prefix *t*- instead of regular *ki*-. Hixkaryána *ka* also shows the complementary distribution of third person *n*- and preceding objects typical of transitive verbs in Cariban (Gildea 1998: 60–81). Due to the semantics of ‘to say’, these objects are either ideophones or direct speech (18).

⁸Cognate segments in Tables 15 to 20 were aligned automatically with LingPy (List et al. 2021), for easier recognition of correspondences.

(18) Hixkaryána

- a. *oni wyaro nkekoni bīryekomo, tiyoni wya*
oni wjaro n-ka-jakoni bīryekomo ti-joni wja
 this like 3-say-REM.CONT boy COR-mother OBL
 ‘This is what the boy said to his mother.’ (Derbyshire 1985: 36)
- b. *moro ha, ketxkoná hatá.*
moro ha ka-jaffkoni hati
 MED.DEM.INAN INTS say-REM.CONT.PL HSY
 ‘‘That one there’’ they said.’ (Derbyshire 1965: 14)

In (18a), the prefix *n-* occurs because there is no preceding object (‘he said it like this’). It does not occur in (18b), because ‘they said’ is preceded by direct speech. Looking beyond Hixkaryána, at least the Tiriyó cognate shows the same pattern, albeit inconsistently so (Carlin 2004: 267).

Derivational suffixes also point to **ka[ti]* ‘to say’ being transitive: Tiriyó *ka* is characterized as the only intransitive verb being able to take the causative suffix *-po* and the agentive nominalizer *-ne* (Meira 1999: 263, 169). The exceptionality of *ka* ‘to say’ taking *-po* ‘CAUS.TR’ has also been noted for Kari’ña (Courtz 2008: 82) and Wayana (Tavares 2005: 258). The agent nominalizer **-ne* gave rise to the Panare gnomic verbal suffix *-ne* on transitive verbs (Gildea 1998: 184–185). The occurrence of *-ne* on *ka* likely led T. E. Payne & D. L. Payne (2013: 214) to categorize it as transitive, contrasting with the intransitive analysis by M.-C. Mattéi-Müller (1994: 102). Finally, reflexes of the causativizer **-metipo*, usually restricted to transitive verbs (Gildea 2015), are found with *ka* in Apalaí (E. Koehn & S. Koehn 1986: 51) and Waiwai (R. E. Hawkins 1998: 52).

The categorization of ‘to say’ as an intransitive verb is supported primarily by its person prefixes. Kari’ña offers a minimal pair between transitive *ka* ‘to remove’ and intransitive *ka* ‘to say’, *sikai* ‘I took it away’ vs *wikai* ‘I said’ (Courtz 2008: 288, 45). Similarly, ‘to say’ has a reflex of 1_{SA} **w-* in Pekodian languages (Section 3.1.1), rather than 1>3 *s-* (Bakairi) or **ini-* (Proto-Xinguan). Additionally, languages which differentiate direct prefixes from *S_A* prefixes by the presence of *i* (Meira et al. 2010: 495) show *i* instead of *i* for this verb, see Akuriyó in (19a), as well as Meira (1999: 294), Tavares (2005: 195), Pachêco (2001: 288), Alves (2017: 150), and Hoff (1968: 168) for cognate forms in other such languages. Finally, the *S_A* class marker *w-* occurs on nominalizations in Kari’ña (19b), and it is probably reflected as vowel length in the Tiriyó (Meira 1999: 333) and Wayana (Tavares 2005: 196) participles.

(19) a. Akuriyó (Meira 1998: 113)

mi-ka
 2-say
 ‘You said.’

b. Kari’ña (Courtz 2008: 202)

Ōmakon ‘wa oti ywykàpo kaiko.
o-ʔma-kon ʔwa oti i-wi-ka-ʔpo kai-ko
 2-child-PL OBL greeting 1-*S_A*-say-PST.NMLZ say-IMP
 ‘Pass my greetings to your children.’

In summary, this verb can be reconstructed as being intransitive based on its (inflectional) prefixes, but transitive based on some (derivational) suffixes. Hixkaryána has lost the main intransitive criteria, making its reflex look more like a transitive verb.

3.2.2 *itə[mə] ‘to go’

This verb is reconstructed by Gildea & D. Payne (2007) as *tə[mə], like *ka[tí] ‘to say’ with a fleeting second syllable. It is true that many reflexes are clearly *t*-initial, for example Hixkaryána *ntoje* ‘he went’ (Derbyshire 1985: 27), Tiriyo *təkə* ‘go!’ (Meira 1999: 246), or Wayana *kuptəm* ‘we went’ (Tavares 2005: 195). However, once one considers all forms of the various reflexes of this verb (Table 16), an initial vowel **i* must clearly be reconstructed – in contrast to unambiguously C-initial *ka[tí] ‘to say’.⁹ This verb was not affected by the any of the extensions in Section 3.1.

[Table 16 about here.]

3.2.3 *eti and *a[p] ‘to be’

For a comprehensive comparative overview of these two roots, readers are referred to Gildea (2018: 375–382); they will not be discussed in detail here. *a[p] is the original copula and can be reconstructed as already having various irregularities in Proto-Cariban. *eti is reconstructed by Meira & Gildea (2009) and Gildea (2018) as originally meaning ‘to dwell, live’, but serving as a copula already in Proto-Cariban.¹⁰ Various modern languages use reflexes of these two roots in a suppletive manner, conditioned by person and/or TAM. Both roots preserved 1S_A *w- in Proto-Pekodian, Proto-Waiwaian, and Proto-Tiriyoan (Sections 3.1.1 to 3.1.3). Akuriyó *a* was not affected by the extension of *k*- (Section 3.1.4), while *eʔi* is not attested in a first-person form. Carijona innovated *j*-, but only in the reflex of *eti (20); the *a* root preserves *w*- (Section 3.1.5). Yukpa introduced *j*- to the reflexes of both *a[p] and *eti, which are preserved as encliticized auxiliaries in certain constructions (21).

- (20) Carijona (Robayo Moreno 1989: 177)
iretibə eʃinəme gərə jefʃi
ireti-bə eʃi-nə=me gərə j-eʃi-i
 then-from be-INF=ATTRZ still 1-be-PFV
 ‘Then I was already grown up.’

- (21) Yukpa (Meira 2006b: 143–144)

	NPST	PST
1	= <i>j</i> -a(-s)	= <i>j</i> -e
2	= <i>mak</i> (o)	= <i>m</i> -e
3	= <i>mak</i> (o)	= <i>n</i> -e

⁹As indicated by the brackets in Table 16, there are many languages where the initial vowel is only present in some forms. Also, the prefix-verb boundary in many inflected forms like e.g. Tiriyo *witənnə* or Arara *widoli* ‘I went’ (Meira 1999: 43; Alves 2017: 153) is ambiguous, since an epenthetic *i* breaks up potential CC clusters. Still, when one considers unambiguous forms, the contrast with *ka[tí] becomes very clear.

¹⁰Such a stative, locative source is also suggested by the existence of *iffi* ‘to lie down’ in Arara (Alves 2017: 196).

3.2.4 **(ət-)jəpi* ‘to come’

[Table 17 about here.]

This verb is reconstructed as **ətepi* by Gildea & D. Payne (2007: 30), but an inspection of all attested reflexes (Table 17) points to a more complex story. Crucially, the majority do not reflect the **ət* part of their reconstruction, and many forms are ostensibly reflexes of **əpi*, **jepi*, or **jəpi*, rather than **epi*. A unifying account of all these forms is achieved by reconstructing a Proto-Cariban form **(ət-)jəpi*, morphologically segmentable into a detransitivizing prefix and a root **jəpi*.

Only the Pemongan languages and Werikyana point to an **j*-initial root, and Werikyana *johi* is very rare in contrast to more frequent *o(o)hi*. It only occurs in the third person form of the Progressive, meaning that the *j* may be a reflex of third person **i-*. As Table 18 shows, regular *o*-initial verbs have no third person prefix, while *i-* occurs with C-initial *to[mo]* ‘to go’. Even if ‘to come’ once shared this *i-*, the circumstances are strongly in favor of a *j*-initial Werikyana root, allowing the reconstruction of Proto-Cariban **jəpi*.

[Table 18 about here.]

Most of the (non-Pemongan) morphologically complex forms corresponding to Gildea & D. Payne’s (2007) **ətepi* show no segmental trace of **j*, but the *i* in Akawaio *asipi* is likely a reflex of the sequence **jə*. This analysis is supported by the reflex *ipi* from bare **jəpi* in very closely related Macushi.

As for the many forms seemingly reflecting **əpi* and **epi* rather than *jəpi*, they are distributed widely in the family, sometimes even co-occurring in the same language. A unifying account requires the root **jəpi* to undergo two major sound changes: a) **j*-loss; and b) **ə*-umlaut after **j*. While both sound changes are found in other contexts throughout the family (Meira et al. 2010), they appear to have applied irregularly to this verb, and not always in the same order. For example, the Kari’ña form *opi* can only be explained if **j* was lost before the umlaut of **ə* to **e*, which would have been triggered by **j*. On the other hand, forms like Ye’kwana *ehə* must be the result of **ə* → **e* / **j*_, with subsequent loss of **j*. The Akuriyó form *eepi* looks like a reflex thereof as well, but the length is unexpected, and is analyzed by Meira (1998) as a coalescence of **e* and **əe*.

While a root **jəpi*, the two sound changes, and the optional addition of **ət-* do account for the majority of the forms in Table 17,¹¹ the distribution within the family is rather chaotic. In addition to the seemingly unordered distribution of **əpi* and **epi*, forms with and without **ət-* can be found within the same language, usually conditioned by different prefixes. This was briefly discussed in Section 3.1.1 for Arara (and Proto-Pekodian) and in Section 3.1.3 for Tiriýó (and Proto-Taranoan). To illustrate, the Tiriýó Set I paradigm shows a reflex of **ətepi* (< **ətjəpi*) for first, but of **epi* (< **jəpi*) for the other persons (22).¹² It should be noted that forms with and without **ət-* in different languages are not triggered by the same person values.

¹¹ Apart from aforementioned Akuriyó *eepi*, another diachronically irregular form is Apalaí *oepe*, where one would expect **ət-epi* to yield *os-epi* (Meira et al. 2010: 506). Similarly, while *oepe* would be a regular outcome of a hypothetical **ə-jəpi*, the / _C allomorph of the detransitivizer is *e-* in Apalaí. One possibility is that the form is due to borrowing from Tiriýó, which has lost intervocalic **t* to create *æpi*. Alternatively, Apalaí *oepe* could be a fossilized loan from Wayana, which has replaced its reflex of **ətjəpi*, but where intervocalic **t* was also regularly lost (Tavares 2005: 63).

¹² While the 1+2 form is a regular outcome of **kit-epi*, the second person form is mysterious (Meira 1998: 115).

(22) Tiriyo (Meira 1999: 294)

- 1 *w-æpi*
 2 *mæn-epi*
 1+2 *ke-epi*
 3 *n-epi*

The interpretation of the **æt* part as a detransitivizer is based on its form and its paradigmatically conditioned occurrence in some languages. Although the combination of a detransitivizer and an intransitive verb seems semantically illogical, some historical S_P verbs are attested as adding the detransitivizer to become S_A verbs. For example, the Proto-Cariban S_P verb **winiki* ‘to sleep’ becomes Tiriyo *æniki* (Meira 1999: 252) and Kari’ña *əʔniki* (Courtz 2008: 429), both S_A. Also, Waiwai ‘go to sleep’ can be *winik* (R. E. Hawkins 1998: 30) or *et-winik* (W. N. Hawkins & R. E. Hawkins 1953: 204). The parallels to ‘to sleep’ end here, since bare **japi* ‘to come’ apparently already was an S_A verb, as evidenced the class membership of its reflexes in Werikyana, Kari’ña, Arara, Tiriyo, and Panare (23).

(23) Panare (T. E. Payne & D. L. Payne 2013: 65)

- ju-w-æpi-n ka=m kano?*
 3-S_A-come-NSPEC Q=2.AUX rain
 ‘Do you think it is gonna rain?’

Summing up, this verb is highly irregular, both from a synchronic and diachronic perspective. The scenario suggested here involves reflexes of the detransitivizer **æt(e)-* being optionally added to an S_A verb root **japi*, which further underwent umlaut and loss of **j*, but in no systematic manner, resulting in the chaotic picture in Table 17. As discussed in Section 3.1.1, innovative **k-* was introduced on the Ikpeng and Bakairi reflexes of **ætjapi*, but not on the Arara reflex of **japi*. Reflexes of **ætjapi* (Tiriyo) and of **ætjapi/*japi* (Akuriyo) resisted the introduction of Proto-Tiriyoan **t-*. Carijona *ehi* shows innovative *j-*, rather than conservative *w-* (24). It is unknown whether there is a Yukpa reflex of this verb, and it was fully replaced in Proto-Waiwaian by **omoki* ‘to come’.

(24) Carijona (Guerrero Beltrán 2019: 102)

- əji-wa-e j-eh-i*
 2-search-SUP 1-come-PFV
 ‘I came looking for you.’

3.2.5 **ipitə* ‘to go down’

Reflexes of this verb were not affected by the extensions of **k-* in Proto-Pekodian (Section 3.1.1) and *k-* in Akuriyo (Section 3.1.4). The resistance against the former extension was subsequently overcome in Bakairi; its fate in Ikpeng is unknown. When Akuriyo extended *k-*, the verb already had a first person form irregularly inflected with *p-*, inherited from Proto-Tiriyoan. One might think that it was also affected by the extensions of *j-* in Carijona (25a) and Yukpa (25b).

- (25) a. Carijona (David Felipe Guerrero, p.c.)
irə waffinakano tae j-ehitə-e
 INAN.ANA body.of.water along.bounded 1-go.down-NPST
 ‘...I go down through that guachinacán.’
- b. Yukpa (Meira 2003b)
aw yéwtu
aw j-ewuhtu
 1PRO 1-go.down
 ‘I went down.’

However, a broader comparative perspective reveals a much more complicated story (Table 19).¹³ It turns out that while a verb **ipitə* can be reconstructed to Proto-Cariban, different (proto-)languages do not agree about its class. Its reflexes in languages that preserve the split-S system are distributed fairly evenly between S_A and S_P.

[Table 19 about here.]

The verb shows traits of both classes in Wayana, necessitating an analysis as a “mixed” verb in a synchronic description of that language. It takes the first and second person S_P markers *j-* and *əw-* (Tavares 2005: 200), but the 1+2S_A marker *kut-* (Tavares 2005: 206). It also shows the S_A class marker *w-* in nominalizations (26a), but behaves like an S_P verb in taking a second person prefix in imperatives (26b).

- (26) Wayana (Tavares 2005: 200)
- | | |
|---|---|
| <p>a. <i>iwiptëë</i>
 <i>i-w-iptə-ri</i>
 1-S_A-go.down-NMLZ
 ‘my going down’</p> | <p>b. <i>əw-iptə-k</i>
 2-go.down-IMP
 ‘Go down!’</p> |
|---|---|

Its causativized form is *iptə-ka* (Tavares 2005: 255); the Proto-Cariban causativizer **-ka* was restricted to S_P verbs (Gildea & Cáceres in preparation). These patterns point to a scenario where the verb was a regular member of the S_P class in pre-Wayana, but partially switched to the S_A class, taking a 1+2S_A prefix and the S_A class marker. This in turn implies that S_A reflexes of this verb in other languages fully switched from S_P in their inflectional patterns.

Wayana-external comparative evidence supports this hypothesis: The Arara causativized form is *eniptoj* (Alves 2017: 66), and Kari’ña has a cognate form *eni?to* (Courtz 2008: 263); *oni?to* ‘to go down’ in Table 19 is a detransitivized form thereof, lit. ‘to get oneself down’. Both causativized forms

¹³In Table 19, parenthesized forms indicate uncertainty about cognacy status. The reconstruction of Proto-Pekodian **iptə* treats the suffixed elements found in the daughter languages as non-cognate. Meira & Franchetto (2005) identify no correspondence between Bakairi *gi* and Ikpeng *ŋ*, and at least the addition of a final *ŋ* in Proto-Xinguan is attested elsewhere: a) Proto-Cariban **əne* ‘to see’, Arara and Ikpeng *eney*; b) Proto-Cariban **əta* ‘to hear’, Arara *taŋ*, Ikpeng *iray*; and c) Proto-Cariban **əna* ‘to eat meat’, Arara *oŋoŋ* ‘to bite’ (Gildea & D. Payne 2007: 8; Alves 2017: 56, 144, 57; Pachêco 2001: 25, 270).

contain a reflex of the transitivizer **en-*, which was usually found with *S_P* verbs (Gildea & Cáceres in preparation). Tiriyo *ih̥tə* has irregular causativized forms that also feature a reflex of **en-* (Meira 1999: 263). Thus, it appears that this verb was originally *S_P*, but then switched its class in four “and a half” languages of the family, for so far unknown reasons.

These circumstances make it impossible to answer the question of whether ‘to go down’ was affected by some extensions. For Proto-Tiriyoan, one cannot establish a relative chronology of the verb class switch, the introduction of the idiosyncratic marker **p-*, and the extension of **t-*. For Proto-Waiwaian, both its first person form and its inflectional class are unknown. For Carijona and Yukpa, one cannot rule out the possibility that the verb switched classes before the breakdown of the split-S system. While no language-internal evidence supports that scenario, ‘to go down’ clearly has an inclination to switch classes; in the case of Carijona, that could have already happened at the Proto-Taranoan stage. In all four cases, the verb could have had *S_A* status at the time of the extension, resisting it and preserving the old prefix, but it could also have had *S_P* status and thus not even have been a potential target.

On the other hand, the class switch happened before the split of Proto-Tiriyoan, and therefore this verb resisted the extension of Akuriyó *k-* as an *S_A* verb. Likewise, it is very likely that the class switch took place before the extension of Proto-Pekodian **k-*. Otherwise, the newly-turned-*S_A* verb would have taken on conservative and lexically heavily restricted **w-*, either in Proto-Pekodian, Proto-Xinguan, or Arara.

3.2.6 **e-pi* ‘to bathe’

This verb resisted the extensions of Proto-Pekodian **k-* (Section 3.1.1) and Akuriyó *k-* (Section 3.1.4). It took on new *1S_A* prefixes in Proto-Tiriyoan (Tiriyo *s-epi-*, Akuriyó *ʃ-epi-* [Meira 1999: 292; Gildea 1994: 87]) and Proto-Waiwaian (Hixkaryána *k-ewehti-*, Waiwai *k-ejeɸu-* [Derbyshire 1985: 195; R. E. Hawkins 1998: 166]). The first person form of its Carijona reflex *ehi* (Koch-Grünberg 1908: 72) is unknown; an unattested Yukpa cognate may exist.

Verbs for intransitive ‘to bathe’ are usually typical *S_A* verbs in Cariban languages, derived with a detransitivizer from a transitive root. These roots are reflexes of **[i]pi*, or **kupi* in some Venezuelan languages (Table 20). Proto-Pekodian can be reconstructed as having the pair **ipi* (INTR) / **ip* (TR). Thus, while Proto-Pekodian ‘to bathe (TR)’ has perfectly regular cognates in other languages of the family, ‘to bathe (INTR)’ diverges by changing **e-* to **i-*. This is an irregular development, since there are no attested reflexes of a Pekodian detransitivizer **i-* (Meira et al. 2010: 506); its cause is unknown. However, other languages also show unexpected developments in this verb, like the glide insertions in Waiwaian or the distribution of **[i]pi* and **kupi* in Venezuelan languages.

[Table 20 about here.]

3.3 Summary

In Section 3.2, the verbs which were unaffected by the extensions in Section 3.1 were reconstructed, and affected reflexes in the languages under discussion were identified. Table 21 gives an overview of what verbs were affected by which extensions (except for *e*-initial Akuriyó verbs unaffected by the extension of *k-*, as they are a large and predictable group). In some cases, the verb does not occur at

all or just not in first person forms (–), in others the first person form is unknown (?), and in the case of ‘to go down’ the question of affectedness is not meaningfully answerable (N/A), for any of the reasons discussed in Section 3.2.5. Every ✓ stands for a verb affected by an extension, while × represents conservatively inflected verbs. This overview makes clear just how strongly these verbs tend to resist person marker extensions, as they do so in different languages.

[Table 21 about here.]

It is astonishing that the same 1-7 verbs retain their old first person marker in 6 distinct developments, while a plethora of regular $S_{(A)}$ verbs take on innovative markers. This suggests that there is something about these verbs which causes them to behave in such a way. Possible answers to the question of what makes them different from regular S_A verbs will be discussed in Section 4, using Bybee’s (1985) network model of morphology.

4 Explaining conservativeness: a network morphology approach

Perhaps the most well-known contribution regarding conservativeness, innovativeness, and (ir-)regularity in the lexicon is Bybee’s (1985) network model of morphology, which seems well-suited for the data at hand. It aims “to account for cross-linguistic, diachronic and acquisition patterns in complex morphological systems” (Bybee 1995: 428). It does so by modeling shared morphological properties such as inflectional patterns as emerging from connections of differing strength between lexemes. A classic example is a network of “strong” English verbs with *striŋ–strai* at the center and pairs like *riŋ–rai*, *spiŋ–pai*, or *stiŋ–tai* at its periphery. This network is attracting new verbs in certain dialects, like *sniŋ–nai* or *brŋi–brai* (Bybee 1985: 129–130). These verbs are recruited based on the lexical connection they form with prototypical members of the group, and accordingly develop irregular or “strong” past tense forms.

As possible bases of these connections between lexemes, Bybee (1985: 118) suggests the criteria of semantic, phonological, and morphological similarity; the English strong verbs are an example for a phonologically motivated network. Another important factor in the model is frequency, since more frequent words have a higher lexical strength (Bybee 1985: 119). This diminishes the influence from other lexemes, meaning that high-frequency items are more likely to resist innovations. For the Cariban first person patterns, the model would predict that a) semantically/phonologically/morphologically similar verbs will be affected by person marker extensions, and b) high-frequency verbs will tend to resist these extensions and thus remain conservative.

When considering the groups of verbs with innovative first person markers (those not in Table 21), there are several factors which could serve as the thread connecting a lexical network. The most obvious similarity is that they all have a reflex of the detransitivizer **ate/e-* (see e.g. Meira [1998: 112] for Taranoan), a hallmark of S_A verbs (Section 2.3). Since all derived S_A verbs begin with reflexes of **a* or **e* (see e.g. Alves [2017: 153] for Arara), phonologically based networks are a second possibility. A third common trait is the S_A (sub-)class membership, represented by pre-innovation first person **w-* (*t-* in Akuriyó). There are no obvious semantic patterns, which is not surprising given the absence of a semantic basis in the split-S system (Section 2.3). Thus, for each extension, there are three hypotheses as to what connected the members of the responsible network: a reflex of DETRZ, their stem-initial phoneme, or a specific $1S_A$ prefix.

It is intuitively obvious that many of the conservative verbs in Table 21 are high-frequency verbs, which would cause conservativeness according to the network model. Going beyond intuition is difficult due to the lack of frequency counts for individual lexemes for any Cariban language. The only statement in the literature is Courtz's (2008: 75) claim of Kari'ña underived S_A verbs being the most frequent ones: "It is difficult [...] to imagine an intransitive or transitive origin for some of the most frequent middle verbs". This claim is supported neither by frequency counts nor accompanied by a list of verbs, but that list is likely identical with the five first columns of Table 21, all underived S_A verbs in Kari'ña. To improve the situation, a count of S_A verbs in three glossed Apalaí texts from E. Koehn & S. Koehn (1994) will serve as a second source of frequency information, the results of which are shown in Table 22. The count data agree with the above interpretation of Courtz's (2008) claim: defining "high frequency" as having an above average count yields the exact same five verbs. While it is uncertain that the interpretation of Courtz's (2008) claim and the small Apalaí sample are truly representative of discourse patterns in the Cariban (proto-)languages under discussion, the absence of alternatives necessitates their use as a tool for modeling frequency.

[Table 22 about here.]

Thus, each of the three hypotheses for possible network factors can be combined with frequency: the members of the lexical network formed by the factor are predicted to undergo innovation, but high-frequency verbs are exempt. The resulting six hypotheses for possible explanations were tested by predicting the expected behavior of each verb in each extension, illustrated in Table 23 for Proto-Tiriyoan. For example, **eʔi* 'to be' is expected to participate (✓) in innovations spreading in a phonologically defined network (being **e*-initial), as well as in an inflectionally defined one (sharing **w*- with other S_A verbs). On the other hand, a network based on the detransitivizer would predict it to not take on new suffixes (×). If frequency is taken into account, it is expected to remain conservative regardless of the basis of the network.

[Table 23 about here.]

These predictions were checked against the data in Table 21, counting verbs which had their behavior (in-)correctly predicted. The resulting scores are illustrated for the extension of Proto-Tiriyoan **t-* in Table 24 and summed up for all extensions in Table 25. Notably, the scores in Table 25 only refer to the seven verbs which are attested as resisting at least one extension. For each extension, there were also many run-of-the-mill S_A verbs which were all affected, except for the Akuriyó *e*-initial verbs.¹⁴ To illustrate, if one adds 1'000 simulated derived S_A verbs per language to the data – a conservative estimate based on Courtz's (2008) Kari'ña dictionary – all six explanations consistently predict the behavior of 99.99+% verbs correctly. However, the present investigation is restricted to the edge cases, since the available data simply does not allow such large-scale tests for Cariban languages.

[Table 24 about here.]

¹⁴While there are a few S_A verbs not transparently derived from transitive verbs (Meira 1999: 252, 2000: 222; Gildea & D. Payne 2007: 30), which are not featured in Table 21, these are mostly **ə*-initial and were likely productively derived at some point. The verbs to which this does not apply, like Tiriyo *wa* 'to dance' (Meira 1999: 252), are all instances of S_P verbs switching classes. Since none of them is attested as being an S_A verb at the time of a person marker extension, they are not relevant for this study.

[Table 25 about here.]

The extent of the extensions in both Proto-Waiwaian and Proto-Pekodian is fully predicted by the presence or absence of a detransitivizer. In both cases, only the underived¹⁵ S_A verbs were not affected, all other S_A verbs taking **k-*. Not shown in Table 25 are subsequent evolutions in the Pekodian daughter languages, which largely support a detransitivizer-based explanation: First, both Ikpeng and Bakairi regularized the paradigm to use forms with detransitivizer for first person (Section 3.1.1), and both introduced *k-*.¹⁶ Second, the development of Proto-Pekodian **itən* ‘to go’ to Ikpeng *aran* may have led to reanalysis of *ar* as a detransitivizer, accompanied by the introduction of *k-*.

The extent of three extensions (in Akuriyó, Carijona, and Yukpa) is correctly predicted by phonological criteria. As discussed in Section 3.1.4, Akuriyó *k-* only appears on *ə*-initial verbs. In Carijona, the extension of *j-* affected all *e-* and *ə*-initial verbs, including *eh* ‘to come’ or *effi* ‘to be’, which do not have a detransitivizing prefix. Only *ka* ‘say’, *təmə* ‘go’, and *a* ‘be-1’ did not take on *j-*. Similarly, the extension of Yukpa *j-* can succinctly be characterized as affecting all vowel-initial verbs; the only attested conservative verb is C-initial *to* ‘to go’.

Inflectional morphology as a network basis only played a potential role in the case of Akuriyó. However, this explanation only works if *t-* and *ff-* are analyzed as distinct morphemes. Since they can also be seen phonologically conditioned allomorphs, the prediction is identical to the phonological one.

When additionally considering the assumed conservative effects of frequency, prediction accuracy was improved in 8 cases, stagnated in 7 cases, and worsened in three cases. These three cases where the tentative model of verb frequency arrives at incorrect predictions are found in Carijona and Yukpa, the only languages to feature innovative markers on the reflexes of **eti* ‘be-2’ or **a[p]* ‘be-1’. Overall, including frequency in the model led to improvements, up to 100% prediction accuracy for all three potential factors in Proto-Tiriyoan, as well as for the phonological criterion in Proto-Pekodian and the inflection criterion in Proto-Waiwaian.

In summary, one can conclude that the patterns of most extensions are correctly predicted not by a single explanation, but rather by 3 to 4 different ones. The exceptions are Carijona and Yukpa, where a phonologically defined lexical network emerges as the unambiguous winner, while frequency-based explanations fare much worse. For the other extensions, the network model gives no unambiguous answer to the question of what (combination of) factors caused innovative first person markers to spread the way they did. This in turn is due to the fact that three of the factors in the model – detransitivizer, phonology, frequency – strongly converge in their predictions: The most frequent S_A verbs are at the same time those without a detransitivizer, and therefore mostly of a different phonological shape than regular S_A verbs.

5 Conclusion

The first research question of this study asked where the irregularly inflected first person forms in some Cariban languages came from. A second question was what verbs are irregular in what lan-

¹⁵Note that for Proto-Pekodian, the idiosyncratic evolution of **e-pi* ‘to bathe (INTR)’ to **ipi* made the verb morphologically opaque.

¹⁶If one instead assumes that first person **w-ebi-* and **k-əd-ebi-* already co-existed in Proto-Pekodian, the clear correlation between **k-* and the detransitivizer remains.

guages. Finally, reasons for their irregularness were sought.

The main findings can be summarized as follows: Verbs irregularly inflected for first person are conservative, leftovers of person marker extensions which left some verbs untouched. Some of these extensions are reconstructible to proto-languages, while others happened in pre-modern stages of single languages. Conservatively inflected verbs show a great degree of overlap between languages, and often behave irregularly in other ways, too. While Bybee's (1985) network model offers explanations for the lexical extent of innovative markers, in 4 of 6 cases it gives no unambiguous answer, as multiple factors predict the same outcome. This is due to the situation reconstructible to Proto-Cariban, where only a small group of frequent S_A verbs had no prefix $*ate/e-$.

While the origins of the split-S system clearly have to do with the detransitivizer, the question why $*ate/e-$ is associated A-oriented prefixes (Meira 2000) is still not answered. Another question to be asked is why the few underived S_A verbs that are reconstructible to Proto-Cariban are not only the most frequent S_A verbs, but arguably the most frequent intransitive verbs ('be', 'say', 'go'). There is no reason why they could not be simple S_P verbs, except maybe in the case of $*ka[ti]$ 'to say' with its transitive tendencies. The answer might be found in the origins of $*ate/e-$ and its association with A-oriented prefixes.

As for Bybee's (1985) network model of morphology, it fulfilled the promise of delivering attractive explanations for irregularities in inflectional patterns. If anything, it overshot its goal somewhat; only two of the four investigated innovations had an unambiguous answer – phonology. It may be noted that across all six hypotheses, the two featuring phonology (one with, once without frequency) together correctly predicted 100% of patterns. Since frequency decreased prediction accuracy in the case of Carijona and Yukpa, it would be interesting to see S_A verb frequency statistics from corpora of these languages. However one interprets the results of the network model investigation, it needs to be pointed out that the ambiguity of its answers are due to the special circumstances in Proto-Cariban, rather than a flaw in the model. Still, the results raise the question how applicable the model is in circumstances where ambiguity arises.

As mentioned, other and more extensive counts of S_A verbs in different Cariban languages would be important not only for comparison with the Apalaí sample, but also providing better input for the network model. Apart from this specific purpose, corpus-based investigations like Sapién et al. (2021) in Cariban languages are direly needed, to accompany the improving descriptive side. Concerning the latter, more extensive descriptive work on Yukpa and Carijona would not only tremendously benefit this paper, but Cariban studies as a whole.

Figure 1: The Cariban language family. Classification by Matter (2021a), positions from Hammarström et al. (2020). Created with a modified version of phytotools (Revell 2012).

Figure 2: Person marking extensions in Parukotoan, after Gildea (1998: 94)

Table 1: Some Hixkaryána verbs (Howard 2001: 150, 510, 511, 513, 520; Derbyshire 1985: 197, 198)

	‘to fall’	‘to be afraid’	‘to walk’	‘to cut self’	‘to be’
1	<i>k-ehurka-</i>	<i>k-oserʲehi-</i>	<i>k-atarʲeknohi-</i>	<i>k-atama-</i>	<i>w-eʃe-</i>
2	<i>m-ehurka-</i>	<i>m-oserʲehi-</i>	<i>m-atarʲeknohi-</i>	<i>m-atama-</i>	<i>m-eʃe-</i>
1+2	<i>t-ehurka-</i>	<i>t-oserʲehi-</i>	<i>t-atarʲeknohi-</i>	<i>t-atama-</i>	<i>t-eʃe-</i>
3	<i>ʃ-ehurka-</i>	<i>n-oserʲehi-</i>	<i>n-atarʲeknohi-</i>	<i>n-atama-</i>	<i>n-eʃe-</i>

Table 2: Some Tiriyo verbs (Meira 1999: 292, 294; Carlin 2004: 274)

	‘to sleep’	‘to see self’	‘to bathe (INTR)’	‘to yawn’	‘to go’
1	<i>t-ənniki-</i>	<i>t-əene-</i>	<i>s-epi-</i>	<i>s-entapo-</i>	<i>wi-tən-</i>
2	<i>m-ənniki-</i>	<i>m-əene-</i>	<i>m-epi-</i>	<i>m-entapo-</i>	<i>mi-tən-</i>
1+2	<i>kit-ənniki-</i>	<i>k-əene-</i>	<i>ke-epi-</i>	<i>k-entapo-</i>	<i>ki-tən-</i>
3	<i>n-ənniki-</i>	<i>n-əene-</i>	<i>n-epi-</i>	<i>n-entapo-</i>	<i>ni-tən-</i>

Table 3: Proto-Cariban Set I (main clause) person markers (Meira et al. 2010: 495; Gildea & Zúñiga 2016: 497)

(a) Transitive					(b) Intransitive		
A/P	1	2	1+2	3	S _A S _P		
1		* <i>k</i> -		* <i>t(i)</i> -	1	* <i>w</i> -	* <i>u(j)</i> -
2	* <i>k</i> -			* <i>m(i)</i> -	2	* <i>m</i> -	* <i>ə(j)</i> -
1+2				* <i>kit(i)</i> -	1+2	* <i>kit</i> -	* <i>k</i> -
3	* <i>u(j)</i> -	* <i>ə(j)</i> -	* <i>k</i> -	* <i>n(i)</i> -	3	* <i>n</i> -	* <i>n(i)</i> -

Table 4: Some examples for completed extensions (Gildea 1998: 90–92)

(a) Apalaí			(b) Panare			(c) Waimiri-Atroari		
	S_A	S_P		S_A	S_P		S	
1	$i-/ \emptyset$	$i-/j-$	1	$w(i)-$	$\emptyset/j-$	1	$w(i)-/i-$	
2	$m(i)-$	$o-$	2	$m(i)-$		2	$m(i)-$	
1+2	$s(i)-$		1+2	$n(i)^{-1}$		1+2	$h(i)-$	
3	$n(i)-$		3	$n(i)-$		3	$n-/ \emptyset$	

¹ Due to the wholesale loss of 1+2 as an person value.

Table 5: Regular Pekodian S_A verbs (Meira 2003a: 4; Alves 2017: 150; Pachêco 2001: 52)

	Bakairi ‘to go up’	Arara ‘to dance’	Ikpeng ‘to run’
1	<i>k-əku-</i>	<i>k-origu-</i>	<i>k-aranme-</i>
2	<i>m-əku-</i>	<i>m-origu-</i>	<i>m-aranme-</i>
1+2	<i>kid-əku-</i>	<i>kud-origu-</i>	<i>kw-aranme-</i>
3	<i>n-əku-</i>	<i>Ø-origu</i>	<i>Ø-aranme-</i>

Table 6: Verbs preserving 1S_A *w- in Proto-Pekodian (Alves 2017: 153, 200; Pachêco 2001: 42, 80, 139, 209; von den Steinen 1892: 76, 130, 131, 374, 397; Pachêco 1997: 68; Meira 2003a: 4)

	Proto-Pekodian	Arara	Ikpeng	Bakairi
‘say’	*wi-ge-	wi-ge-	i-ge-	u-ge-
‘go’	*w-itən-	w-ido-	k-aran-	u-tə-
‘be-1’	*w-ap-	w-ap-	–	w-a-
‘be-2’	*w-effi-	w-iffi-	Ø-effi-	w-i-
‘come’	*w-epi-	w-ebi-	k-arep-	k-æwi-
‘go down’	*w-iptə-	w-ipton-	?-ipton-	k-itagi-
‘bathe’	*w-ipti-	w-ibi-	Ø-ip-	w-i-

Table 7: Loss of **w* in Ikpeng (de Souza 1993: 44, 70; Alves Chagas 2013: 118; Alves 2017: 143; Pachêco 2001: 21, 164; de Souza 2010: 9; Campetela 1997: 40)

Meaning	Arara	Ikpeng
‘to defecate’	<i>watke</i>	<i>atke</i>
‘DAT’	<i>wina</i>	<i>ina</i>
‘dog’	<i>wokori</i>	<i>akari</i>
‘capuchin monkey’	<i>tawe</i>	<i>tae</i>
‘to sleep’	<i>winki</i>	<i>inki</i>

Table 8: Regular ‘to fall’ (S_A) and ‘to sleep’ (S_P) in Proto-Waiwaian (Howard 2001: 150; Derbyshire 1985: 189, 190, 196; R. E. Hawkins 1998: 30; W. N. Hawkins & R. E. Hawkins 1953: 209, 211)

	Proto-Waiwaian ‘to fall’	‘to sleep’	Hixkaryana ‘to fall’	‘to sleep’	Waiwai ‘to fall’	‘to sleep’
1	<i>*k-epurka-</i>	<i>*ki-winiki-</i>	<i>k-ehurka-</i>	<i>ki-niki-</i>	<i>k-epirka-</i>	<i>ki-winiki-</i>
2	<i>*m-epurka-</i>	<i>*o-winiki-</i>	<i>m-ehurka-</i>	<i>o-wniki-</i>	<i>m-epirka-</i>	<i>mi-winiki-</i>
1+2	<i>*t-epurka-</i>	<i>*tit-winiki-</i>	<i>t-ehurka-</i>	<i>ti-niki-</i>	<i>tj-epirka-</i>	<i>tit-winiki-</i>
3	<i>*ɲ-epurka-</i>	<i>*ni-winiki-</i>	<i>ɲ-ehurka-</i>	<i>ni-niki-</i>	<i>ɲ-epirka-</i>	<i>ni-winiki-</i>

Table 9: Verbs preserving 1S_A *w- in Proto-Waiwaian (Derbyshire 1979: 4; R. E. Hawkins 1998: 71, 85; Derbyshire 1985: 70, 197, 198; p.c., Spike Gildea)

	Proto-Waiwaian	Hixkaryána	Waiwai
‘say’	*wi-ka-	i-ka-	wi-ka-
‘go’	*wi-tom-	i-to-	kɪw-tom-
‘be-1’	*w-ah-	w-ah-	w-a-
‘be-2’	*w-efi-	w-efe-	w-eefi-

Table 10: Regular Proto-Tiriyoan S_A verbs (Meira 1999: 292, 294; Gildea 1994: 87)

	'to bathe (INTR)'			'to sleep'		
	Proto-Tiriyoan	Tiriyó	Akuriyó	Proto-Tiriyoan	Tiriyó	Akuriyó
1	* <i>ʃ-epi-</i>	<i>s-epi-</i>	<i>ʃ-epi-</i>	* <i>t-əəniki-</i>	<i>t-əəniki-</i>	<i>k-əəniki-</i>
2	* <i>m-epi-</i>	<i>m-epi-</i>	<i>m-epi-</i>	* <i>m-əəniki-</i>	<i>m-əəniki-</i>	<i>m-əəniki-</i>
1+2	* <i>ke-epi-</i>	<i>ke-epi-</i>	<i>ke-epi-</i>	* <i>kit-əəniki-</i>	<i>kit-əəniki-</i>	<i>kəʔ-əəniki-</i>
3	* <i>n-epi-</i>	<i>n-epi-</i>	<i>n-epi-</i>	* <i>n-əəniki-</i>	<i>n-əəniki-</i>	<i>n-əəniki-</i>

Table 11: Verbs preserving 1S_A **w*- in Proto-Tiriyóan (Meira 1999: 292, 294, 339, 1998: 112, 113, 114, 115, 165)

	Proto-Tiriyóan	Tiriyó	Akuriyó
‘say’	* <i>wi-ka-</i>	<i>wi-ka-</i>	<i>wi-ka-</i>
‘go’	* <i>wi-təmi-</i>	<i>wi-tən-</i>	<i>ə-təmi-</i>
‘be-1’	* <i>w-a-</i>	<i>w-a-</i>	<i>∅-a-</i>
‘be-2’	* <i>w-eʔi-</i>	<i>w-ei-</i>	<i>?-eʔi-</i>
‘come’	* <i>w-əʔepti-</i>	<i>w-əepti-</i>	<i>∅-eəpti-</i>

Table 12: Regular Akuriyó 1S_A markers (Gildea 1994: 77, 79, 82, 84, 85, 86, 87)

first person <i>k</i> -	first person <i>fj̃</i> -
<i>əempa</i> - ‘to learn’	<i>epi</i> - ‘to bathe (INTR)’
<i>əəf̃əna</i> - ‘to cry’	<i>ekirika</i> - ‘to stay back’
<i>əiwa</i> - ‘to tremble’	<i>entapo</i> - ‘to yawn’
<i>əməmi</i> - ‘to enter’	<i>etonema</i> - ‘to lie down’
<i>ətajij̃ka</i> - ‘to run’	<i>ewai</i> - ‘to sit down’
<i>əturu</i> - ‘to talk’	<i>ehpa</i> - ‘to bathe (INTR)’
<i>əəniki</i> - ‘to sleep’	

Table 13: Regular Carijona verbs (Robayo Moreno 2000: 173; Meira 1998: 106)

	‘to dance’	‘to arrive’
1	<i>j-eharaga-</i>	<i>ji-tuda-</i>
2	<i>m-eharaga-</i>	<i>mi-tuda-</i>
1+2	<i>kis-eharaga-</i>	<i>kisi-tuda-</i>
3	<i>n-eharaga-</i>	<i>ni-tuda-</i>

Table 14: Regular Yukpa verbs (Meira 2006b: 139; Largo 2011: 72, 76)

	‘to fall’	‘to wash self’	‘to sleep’
1	<i>j-ata-</i>	<i>j-otum-</i>	<i>ji-ni-</i>
2	<i>m-ata-</i>	<i>m-otum-</i>	<i>mi-ni-</i>
3	<i>n-ata-</i>	<i>n-otum-</i>	<i>ni-ni-</i>

Table 15: Reflexes of **ka[ti]* ‘to say’ (Meira 2005: 267, 2003a: 4; Franchetto 2008: 48; Pachêco 2001: 209, 209, 279; Alves 2017: 80, 153; Derbyshire 1985: 182; Meira 1998: 113; E. Koehn & S.
